Architecture Description

Unit Test Cases

# INTRODUCTION

## Why this low Level Document?

The objective of a low-level design document is to provide an internal reference for the development team. The logical design of the program code for adult census income prediction was carefully crafted. The class diagrams are used to illustrate the relationships between classes and program specifications. It is important to note that the programmer can directly code the program without the need for any additional modules or libraries.

## Scope

Low-level design (lld) is a step-by-step refinement process that focuses on designing individual components. This process can be utilized for.

Designing data structures, required software architecture, sourcecode, and ultimately, performance algorithms. Overall, the data organization can be defined during requirement analysis and then refined during the data design work.

# ARCHITECTURE

## Proposed Methodology

## Deployment Process

It was deployed locally.

# ARCHITECTURE DESCRIPTION

## Data Description

The dataset called adult census income is accessible on kaggle and ci.

Repository: This information was obtained from the 1994 census database by Ronny Kohavi and Barry Becker (data mining and analysis).

Visualization, silicon graphics). The prediction task is to determine whether a person earns more than \$50,000 annually or not.

## Data Preparation

This step encompasses all the essential actions that occur during the lifecycle of.

The data science project focused on three main tasks: data cleaning, exploratory data analysis (eda), and outlier treatment. In this step, our data is prepared to be fed into our machine learning model.

## Model Development

This step encompasses all other essential steps, including feature.

Engineering, feature selection, model selection, and hyperparameter tuning.

Tuning the model to create the most precise and accurate prediction possible.

# UNIT TEXT CASES

| Test Case Description                                                                 | Pre-Requisite                                                | Expected Result                                                 |
|---------------------------------------------------------------------------------------|--------------------------------------------------------------|-----------------------------------------------------------------|
| Verify whether the Application URL is accessible to the user                          | Application URL should be defined                            | Application URL should be accessible to the user                |
| Verify whether the Application loads completely for the user when the URL is accessed | 1.Application URL is accessible<br>2.Application is deployed | Application URL should be defined                               |
| Verify whether user is able to see input fields.                                      | Application is accessible                                    | User should be able to see input fields                         |
| Verify whether user is able to edit all input fields                                  | Application is accessible                                    | User should be able to edit all input fields                    |
| Verify whether user gets Submit button to submit the inputs                           | Application is accessible                                    | User should get Submit button to submit the inputs              |
| Verify whether user is presented with results on clicking submit                      | Application is accessible                                    | User should be presented with results on clicking submit        |
| Verify whether the results are in accordance to the selections user made              | Application is accessible                                    | The results should be in accordance to the selections user made |
